

SEP3 Project Requirements

You must choose and utilize a software development methodology (e.g. Scrum and AUP) for the development process.

You have full freedom in the choice of domain (but your proposal needs to be approved by your supervisors).

Your project must be under version control (Git) for the entire development process.

Based on [SEP3 course description](#):

- Create a distributed system
- The system must be heterogeneous (you must use Java *and* C#)
- The system must contain server to server communication (i.e. a client-server system is not enough)
- The system must use at least two different network technologies (e.g. REST, gRPC, RabbitMQ, sockets, GraphQL, etc.)
- The system must include a GUI for the client(s)
- The system must have one or more databases
- Your report must contain a section discussing your choice of technology and architecture by comparing it to alternative approaches

Specific requirements for deliverables

[Formal Criteria for upload of SEP](#) must be adhered to.

Report

- 8-12 pages (1 page = 2400 characters incl. spaces), excluding appendices.

Source Code

- The source code of the entire project must be included as a .zip file.

Github

- A link to the source code on GitHub must be included in a github.txt file.

Video Demonstration

- A link to a video demonstration of the complete system in action must be included in a demo.txt file. No more than 3 minutes.
